

Vector Towards Recovery

- What risks do we want to take while moving towards recovery in Stage 1?
- For example: Do we want to achieve improvements in all resource areas, or increase the likelihood of recovery with a cost to water supply and possibly water quality?

Water Supply Improvements

- What is the base by which we judge incremental benefit?
 - Accord plus upstream AFRP actions (Dec 1994)
 - Accord plus upstream and in-Delta AFRP actions.

Net Water Supply -- Critical Period Average

WS target for Stage 1

- With accord and upstream and in-Delta AFRP actions plus NoName actions as a base, the incremental critical period water supply benefit should be around 50 to 100 TAF

DNCT- Key is Operational Flexibility

- Curtailing pumping at environmentally sensitive times and enhanced pumping at less sensitive times
 - Base Line of operations
 - Flexible operation rules around base line, based on real time monitoring
 - Environmental water account
 - Monitoring and adaptive management

CEQA/NEPA

- What are the bookends we should use for operation in our impact analysis?
